

StakeWith.Us

Security Assessment

December 23rd, 2020

For:

StakeWith.Us

Ву:

Alex Papageorgiou @ CertiK <u>alex.papageorgiou@certik.org</u>

Georgios Delkos @ CertiK georgios.delkos@certik.io

CertiK reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts CertiK to perform a security review.

CertiK Reports do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

CertiK Reports should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

CertiK Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. CertiK's position is that each company and individual are responsible for their own due diligence and continuous security. CertiK's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

What is a CertiK report?

- A document describing in detail an in depth analysis of a particular piece(s) of source code provided to CertiK by a Client.
- An organized collection of testing results, analysis and inferences made about the structure, implementation and overall best practices of a particular piece of source code.
- Representation that a Client of CertiK has indeed completed a round of auditing with the intention to increase the quality of the company/product's IT infrastructure and or source code.

Project Summary

Project Name	StakeWith.Us
Description	This is a joint report of the two audit rounds conducted on the Unagi vault implementation of StakeWith.Us focusing on the implementation itself and the new investment strategies introduced by the team that add support for a wider gamma of stablecoins including PAX, Binance USD (BUSD) and Gemini (GUSD) respectively.
Platform	Ethereum; Solidity, Yul
Codebase	GitHub Repository
Commits	 74c2ebeabd27ad8fae7fcc002aac1ea9d76f922f 289bb073c63418cd8e826ebd45f8cdfadfe965e7 264d38333e5da89359ab9dc5cecc63bb1678df8c

Audit Summary Round 1

Delivery Date	November 19th, 2020	
Method of Audit	Static Analysis, Manual Review	
Consultants Engaged	2	
Timeline	November 16th, 2020 - November 19th, 2020	

Audit Summary Round 2

Delivery Date	December 23rd, 2020
Method of Audit	Static Analysis, Manual Review
Consultants Engaged	2
Timeline	December 15th, 2020 - December 23rd, 2020

Vulnerability Summary

Total Issues	13
Total Critical	0
Total Major	0
Total Medium	2
Total Minor	4
Total Informational	7

The audit of the codebase was conducted from two different viewpoints; a security perspective and an optimizational perspective, the former taking precedence over the latter. The StakeWith.Us team laid some of the security assumptions they wished validated directly on the codebase which we proceeded to utilize as building blocks of our security analysis of the project.

We observed several security standards and practices applied to the codebase, such as flash-loan protection via tx.origin and a whitelist, strict role-based access-control akin to OpenZeppelin's implementation, slippage protection for withdrawals via dynamic balance evaluation, re-entrancy protection via mutexes and more.

The contracts of the project interface with many DeFi blocks which were treated as black-boxes during the audit and only analyzed from an interfacing and expected functionality standpoint.

From an optimizational perspective, we observed certain minor security assumptions that were instead expected to be complied to by the administrative caller of the contracts rather than the code itself. We noted that these should instead be assimilated directly in the codebase for peaceof-mind as well as ensuring that security comes first.

With regards to the mathematical operations that are conducted across the codebase, we validated their definitions according to in-line comments and identified no flaws in the way they are carried out. We pinpointed certain SafeMath invocations that could be omitted as they are guaranteed by preceding if and require clauses in favor of gas optimization.

Funds are not meant to remain at rest, which is further indicated by the way investments in strategies are directly utilized in their respective staking methodology. The contract utilizes ephemeral balance calculation to detect how many funds were deposited and withdrawn from a particular strategy as well as DeFi component, ensuring that no assumptions are made with regards to the impact of external DeFi calls.

We should note that the strategies rely on price calculations that are based on-chain, meaning that they would be susceptible to flash-loan attacks by manipulating the price of given pairs to the attacker's benefit. However, such attempts are impossible in the codebase of the Unagi contracts as both the deposit and withdraw functions are safe-guarded against flash loans. We should note that both functions should remain guarded as it would be possible for a flash-loaner to affect the result of a deposit and withdraw combination by first depositing real funds and affecting their withdrawal with the flash-loan.

As per the security considerations, direct underlying token deposits to the vault or strategy should not impact their operation as balances are dynamically evaluated at each point of execution. For example, a manual deposit to a <code>Vault</code> would affect the number of shares minted by <code>deposit</code>, however the output of <code>withdraw</code> would also be proportionately affected as the <code>_getExpectedReturn</code> function also factors these balances into account. Likewise, direct deposits to a <code>Strategy</code> would be accounted for by the <code>withdraw</code> and <code>withdrawAll</code> functions.

The sole important implementation flaws we identified are the 2 medium severity vulnerabilities that involve the 3Curve strategies and in detail their re-investment functionality. The strategies are meant to implement a _getMostPremiumToken that retrieves the stablecoin out of the three that contains the least balance and should be re-invested in the pool by swapping acquired CRV tokens for the particular stablecoin. As the implementation is incorrect, we highly urge this is dealt with prior to launch.

One thing that should be noted is that the built-in slippage protection parameters of Pickle Finance, Uniswap and Curve are not utilized directly. Withdrawals are guaranteed to not slip as the Vault implementation contains manual slippage protection, however the deposits do not seem to utilize this functionality. This would allow a malicious sand-which attack to occur, leading to a user's deposit resulting in less funds than originally planned. This attack vector can only be utilized maliciously to decrease the value of a user's deposit and can be considered negligible as the slippage of the supported stablecoins of the project is minimal.

The StakeWith.Us team remediated all the findings outlined in the report apart for VAU-01 which was extensively discussed with us and concluded to be negligible in the overall security of the project.

During the second audit round, we were tasked with auditing new strategy implementations that rely on the original Curve base but utilize other curve pools for other types of stablecoins as well as a no-operation strategy that is meant to be empty and utilized only in emergency scenarios. We identified a single issue within the no-operation strategy that we believe should be remediated prior to launch as well as a comment inaccuracy within the new strategies.

Туре	Severity	Location
Logical Issue	Informational	Controller.sol L38-L45

The linked code segment contains comments that warn a call of the setAdmin function shuold be preceded by a revocation of the ADMIN_ROLE and HARVESTER_ROLE for the old administrator and a grant of these for the new administrator.

Recommendation:

We advise that these are instead performed directly on the code to ensure that these security considerations cannot be bypassed and are instead guaranteed by the code.

Alleviation:

The team migrated the restrictions mentioned in the comments to actual statements carried out within the function body thus addressing this issue.

Туре	Severity	Location
Control Flow	Minor	Controller.sol L83, L99, L108, L118

The linked warning comments indicate that the associated functions are able to make "sensitive" calls to Istrategy instances that are not associated with a particular vault.

Recommendation:

We advise that the warning comments are integrated within the code, either within the definition of a generic strategy (StrategyBase.sol) or within Controller.sol directly by invoking the getter function of the vault within the strategy and ensuring that the Strategy of the vault is the same as the strategy we are making an invocation to.

Alleviation:

All invocations on an Istrategy were adapted to be guared by a modifier that ensures the strategy's vault is utilizing it, thus preventing the warning comment that existed earlier from manifesting under any circumstances.

Туре	Severity	Location
Control Flow	Minor	<u>Controller.sol L99-L106, L108-L116</u>

The function withdraw can be invoked by anyone with the HARVESTER_ROLE whereas the withdrawAll function can only be called by the ADMIN_ROLE, as the code dictates.

Recommendation:

As the strategy implementations of withdrawall act like a withdraw with the amount set to the maximum, a HARVESTER_ROLE is able to replicate a withdrawall invocation by setting proper input parameters for withdraw. As such, we advise that the access control for these functions is revised since they do not properly achieve their purpose.

Alleviation:

The withdrawall function was adapted to also utilize the HARVESTER_ROLE as it was basically a utility case of the withdraw function HARVESTER_ROLE was already able to invoke.

Туре	Severity	Location
Gas Optimization	Informational	<u>TimeLock.sol L43-L44</u> , <u>L47</u> , <u>L63-L73</u>

The variable delay is assigned to during the constructor of the contract after passing certain checks that are also imposed by the setDelay function.

Recommendation:

We advise that the constructor of the contract utilizes the setDelay function directly by splitting its implementation to an internal that simply conducts the statements and an external that applies proper access control.

Alleviation:

The _setDelay setter is now properly invoked in the constructor leading to a reduction in the contract's generated bytecode.

Туре	Severity	Location
Mathematical Operation	Minor	<u>Vault.sol L429-L437</u> , <u>L440</u>

The first code block calculates the fee that should be acquired from the withdrawAmount of a particular user. The latter code line imposes a require check on the amount withdrawn based on the user's _min input.

Recommendation:

As the minimum of a withdrawal is imposed by the user, it is possible for the user to invoke withdraw repeatedly with a small amount bypassing the fee due to the withdrawal fee resulting in 0 because of truncation. We advise that the require check of L440 calculates the minimum between min and FEE MAX to ensure that the division does not result in 0.

Alleviation:

After discussing with the StakeWith.Us team, we concluded that any type of solution to this particular issue would restrain the actions a user would be able to take and as such we collectively agreed that no action should be taken to remediate this exhibit as its impact is minimal and potentially negligible.

Туре	Severity	Location
Gas Optimization	Informational	<u>Vault.sol L230, L378, L426,</u> <u>L430, L435</u>

The linked mathematical statements utilize numbers wrapped around the SafeMath library to ensure operations are carried out safely.

Recommendation:

The usage of SafeMath in the linked statements is redundant as their result is guaranteed to be safe based on if conditionals or require checks that precede them. We advise they are omitted to optimize the gas cost of the contract.

Alleviation:

The linked statements were optimized by removing the utilization of SafeMath as they are guaranteed to be safe by surrounding statements.

Туре	Severity	Location
Gas Optimization	Informational	StrategyBase.sol L92, L142, L205

The linked mathematical statements utilize numbers wrapped around the safeMath library to ensure operations are carried out safely.

Recommendation:

The usage of SafeMath in the linked statements is redundant as their result is guaranteed to be safe based on if conditionals or require checks that precede them. We advise they are omitted to optimize the gas cost of the contract.

Alleviation:

The linked statements were optimized by removing the utilization of SafeMath as they are guaranteed to be safe by surrounding statements.

Туре	Severity	Location
Gas Optimization	Informational	StrategyCurve.sol L44, L120

The linked mathematical statements utilize numbers wrapped around the safeMath library to ensure operations are carried out safely.

Recommendation:

The usage of SafeMath in the linked statements is redundant as their result is guaranteed to be safe based on if conditionals or require checks that precede them. We advise they are omitted to optimize the gas cost of the contract.

Alleviation:

The linked divisions were properly replaced with their raw format as the divisors are literals that will always be different than zero.

Туре	Severity	Location
Logical Issue	Medium	Strategy3Crv.sol L48-L70

The linked _getMostPremiumToken implementation compares the balances of the three stablecoins held in the Curve pool by offsetting them to the proper number of decimals and comparing them in sequence using a less-than (<) comparator, in the end returning DAI as the most premium stablecoin if the previous if conditionals fail.

Recommendation:

The implementation is invalid as the default value returned will can be the least-premium token. If the balances of <code>USDC</code> and <code>USDT</code> are equal but less-than <code>DAI</code>, all conditionals will fail and the function will return <code>DAI</code> when in-fact the most premium token is either <code>USDC</code> or <code>USDT</code>. We advise that the <code>if</code> conditionals utilize a less-than-or-equal comparison instead and the last <code>if</code> clause is omitted to ensure that the event of equal balances is taken into account.

Alleviation:

The premium token calculation was corrected by utilizing a less-than-or-equal comparison instead of a strict less-than comparison, nullifying this exhibit.

Туре	Severity	Location
Gas Optimization	Informational	StrategyCusd.sol L62-L65

The linked code block of _getMostPremiumToken checks for the balance difference between DAI and USDC and returns DAI as the most premium token if the balance is less, which is also the default return value of the function.

Recommendation:

As DAI is returned by default, the whole if clause can be omitted optimizing gas cost.

Alleviation:

The _getMostPremiumToken function was optimized to instead conduct a single comparison instead of two, leading to a reduction in gas cost.

Туре	Severity	Location
Logical Issue	Medium	StrategyP3Crv.sol L110-L135

The linked _getMostPremiumToken implementation compares the balances of the three stablecoins held in the Curve pool by offsetting them to the proper number of decimals and comparing them in sequence using a less-than (<) comparator, in the end returning DAI as the most premium stablecoin if the previous if conditionals fail.

Recommendation:

The implementation is invalid as the default value returned will can be the least-premium token. If the balances of <code>USDC</code> and <code>USDT</code> are equal but less-than <code>DAI</code>, all conditionals will fail and the function will return <code>DAI</code> when in-fact the most premium token is either <code>USDC</code> or <code>USDT</code>. We advise that the <code>if</code> conditionals utilize a less-than-or-equal comparison instead and the last <code>if</code> clause is omitted to ensure that the event of equal balances is taken into account.

Alleviation:

The premium token calculation was corrected by utilizing a less-than-or-equal comparison instead of a strict less-than comparison, nullifying this exhibit.

Туре	Severity	Location
Inconsistency	Informational	StrategyPax.sol L22

The Curve pool for PAX pairs the PAX token with yc prefixed pairs while the linked comment denotes otherwise.

Recommendation:

We advise the comment is adjusted to properly reflect the prefix as is with other pools.

Alleviation:

A comment was introduced properly explaining the trade pair's actual denomination.

Туре	Severity	Location
Logical Issue	Minor	StrategyNoOp.sol L87-L89, L91-L94

The Noop strategy is meant to be an emergency temporary place-in for a conventional strategy. As such, it burrows the same concepts and contains an underlying token that cannot be withdrawn by the sweep function the admin can invoke to rescue funds. However, this also prevents underlying funds from being recovered once the temporary strategy is replaced as exit does not transfer the said funds back to the Vault.

Recommendation:

We advise that the exit function is adjusted to also transfer any accidental leftovers of underlying within the Noop strategy itself.

Alleviation:

The exit function was adjusted according to our recommendation, transferring any underlying funds it has back to the Vault.

Appendix

Finding Categories

Gas Optimization

Gas Optimization findings refer to exhibits that do not affect the functionality of the code but generate different, more optimal EVM opcodes resulting in a reduction on the total gas cost of a transaction.

Mathematical Operations

Mathematical Operation exhibits entail findings that relate to mishandling of math formulas, such as overflows, incorrect operations etc.

Logical Issue

Logical Issue findings are exhibits that detail a fault in the logic of the linked code, such as an incorrect notion on how block.timestamp works.

Control Flow

Control Flow findings concern the access control imposed on functions, such as owner-only functions being invoke-able by anyone under certain circumstances.

Volatile Code

Volatile Code findings refer to segments of code that behave unexpectedly on certain edge cases that may result in a vulnerability.

Data Flow

Data Flow findings describe faults in the way data is handled at rest and in memory, such as the result of a struct assignment operation affecting an in-memory struct rather than an instorage one.

Language Specific

Language Specific findings are issues that would only arise within Solidity, i.e. incorrect usage of private or delete.

Coding Style

Coding Style findings usually do not affect the generated byte-code and comment on how to make the codebase more legible and as a result easily maintainable.

Inconsistency

Inconsistency findings refer to functions that should seemingly behave similarly yet contain different code, such as a constructor assignment imposing different require statements on the input variables than a setter function.

Magic Numbers

Magic Number findings refer to numeric literals that are expressed in the codebase in their raw format and should otherwise be specified as **constant** contract variables aiding in their legibility and maintainability.

Compiler Error

Compiler Error findings refer to an error in the structure of the code that renders it impossible to compile using the specified version of the project.

Dead Code

Code that otherwise does not affect the functionality of the codebase and can be safely omitted.
